

1. I made contrast corrections by changing the color and making the font bigger. I also inputted alt for images in case the images do not load. Lastly, I put a label for the input box.
2. The accessibility problems are not all solvable as the photos or captions are not available for everyone. For example, photos cannot be transmitted to blind people as they are not able to be seen, and as photos or captions are user created, they won't be posted with the intention of being accessible for blind people.
3. I do think my website is usable if I turn off the CSS as the CSS is there for the styling. Although it is not the most visually appealing, all the links and captions should still be accessible.
4. If the image is turned off, the website is still usable due to the alternative text I imputed for each image. As a result, even if there is no image, the user will still be able to read a description of it.

5.

The following apply to the entire page:
